**Cross-Reference to Related Applications**

5 This is a continuation-in-part of Serial No. 09/425,228 filed October 22, 1999 which is a continuation-in-part of Serial No. 09/257,266 filed February 25, 1999, which claims priority to Serial Nos. 60/115,877 and 60/115,878 filed January 13, 1999.

**Field of the Invention**

10 This invention relates to the use of a group of aryl ureas in treating raf mediated diseases, and pharmaceutical compositions for use in such therapy.

**Background of the Invention**

The p21<sup>ras</sup> oncogene is a major contributor to the development and progression of human solid cancers and is mutated in 30% of all human cancers (Bolton et al. *Ann. Rep. Med. Chem.* **1994**, *29*, 165-74; Bos. *Cancer Res.* **1989**, *49*, 4682-9). In its normal, unmutated form, the ras protein is a key element of the signal transduction cascade directed by growth factor receptors in almost all tissues (Avruch et al. *Trends Biochem. Sci.* **1994**, *19*, 279-83). Biochemically, ras is a guanine nucleotide binding protein, and cycling between a GTP-bound activated and a GDP-bound resting form is strictly controlled by ras' endogenous GTPase activity and other regulatory proteins. In the ras mutants in cancer cells, the endogenous GTPase activity is alleviated and, therefore, the protein delivers constitutive growth signals to downstream effectors such as the enzyme raf kinase. This leads to the cancerous growth of the cells which carry these mutants (Magnuson et al. *Semin. Cancer Biol.* **1994**, *5*, 247-53). It has been shown that inhibiting the effect of active ras by inhibiting the raf kinase signaling pathway by administration of deactivating antibodies to raf kinase or by co-expression of dominant negative raf kinase or dominant negative MEK, the substrate of raf kinase, leads to the reversion of transformed cells to the normal growth phenotype (see: Daum et al. *Trends Biochem. Sci.* **1994**, *19*, 474-80; Fridman et al. *J. Biol. Chem.* **1994**, *269*, 30105-8. Kolch et al. (*Nature* **1991**, *349*, 426-28) have further indicated that inhibition of raf expression by antisense RNA blocks cell proliferation in membrane-associated oncogenes. Similarly, inhibition of raf kinase (by antisense oligodeoxynucleotides) has been correlated in

vitro and in vivo with inhibition of the growth of a variety of human tumor types (Monia et al., *Nat. Med.* 1996, 2, 668-75).

#### Summary of the Invention

5 The present invention provides compounds which are inhibitors of the enzyme raf kinase. Since the enzyme is a downstream effector of p21<sup>ras</sup>, the inhibitors are useful in pharmaceutical compositions for human or veterinary use where inhibition of the raf kinase pathway is indicated, e.g., in the treatment of tumors and/or cancerous cell growth mediated by raf kinase. In particular, the compounds are useful in the treatment of human or animal solid cancers, e.g., murine cancer, since the progression of these cancers is dependent upon the ras protein signal transduction cascade and therefore susceptible to treatment by interruption of the cascade, i.e., by inhibiting raf kinase. Accordingly, the compounds of the invention are useful in treating cancers, including solid cancers, such as, for example, carcinomas (e.g., of the lungs, pancreas, thyroid, bladder or colon), myeloid disorders (e.g., myeloid leukemia) or adenomas (e.g., villous colon adenoma).

10 The present invention therefore provides compounds generally described as aryl ureas, including both aryl and heteroaryl analogues, which inhibit the raf kinase pathway. The invention also provides a method for treating a raf mediated disease state in humans or  
15 mammals. Thus, the invention is directed to compounds which inhibit the enzyme raf kinase and also compounds, compositions and methods for the treatment of cancerous cell growth mediated by raf kinase wherein a compound of Formula I is administered or pharmaceutically acceptable salt thereof.

The present invention is also directed to pharmaceutically acceptable salts of formulae (I), (Ia), (Ib) and (Ic). Suitable pharmaceutically acceptable salts are well known to those skilled in the art and include basic salts of inorganic and organic acids, such as hydrochloric acid, hydrobromic acid, sulfuric acid, phosphoric acid, methanesulphonic acid, trifluoromethanesulfonic acid, benzenesulfonic acid, *p*-toluenesulfonic acid, 1-naphthalenesulfonic acid, 2-naphthalenesulfonic acid, acetic acid, trifluoroacetic acid, malic

In addition, pharmaceutically acceptable salts include acid salts of inorganic bases, such as salts containing alkaline cations (e.g.,  $\text{Li}^+$   $\text{Na}^+$  or  $\text{K}^+$ ), alkaline earth cations (e.g.,  $\text{Mg}^{+2}$ ,  $\text{Ca}^{+2}$  or  $\text{Ba}^{+2}$ ), the ammonium cation, as well as acid salts of organic bases, including aliphatic and aromatic substituted ammonium, and quaternary ammonium cations, such as those arising from protonation or peralkylation of triethylamine, *N,N*-diethylamine, *N,N*-dicyclohexylamine, lysine, pyridine, *N,N*-dimethylaminopyridine (DMAP), 1,4-diazabicyclo[2.2.2]octane (DABCO), 1,5-diazabicyclo[4.3.0]non-5-ene (DBN) and 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU).

A number of the compounds of formulae (I), (Ia), (Ib) and (Ic) possess asymmetric carbons and can therefore exist in racemic and optically active forms. Methods of separation of enantiomeric and diastereomeric mixtures are well known to one skilled in the art. The present invention encompasses any isolated racemic or optically active form of compounds described in Formula I which possess raf inhibitory activity.

One of ordinary skill in the art will recognize that some of the compounds of formulae (I), (Ia), (Ib) and (Ic) can exist in different geometrical isomeric forms. In addition, some of the compounds of the present invention possess one or more asymmetric carbon atoms and are thus capable of existing in the form of optical isomers, as well as in the form of racemic or nonracemic mixtures thereof, and in the form of diastereomers and diastereomeric mixtures. All of these compounds, including *cis* isomers, *trans* isomers, diastereomeric mixtures, racemates, nonracemic mixtures of enantiomers, substantially pure, and pure enantiomers, are considered to be within the scope of the present invention. Herein, substantially pure enantiomers is intended to mean that no more than 5% w/w of the corresponding opposite enantiomer is present.

The optical isomers can be obtained by resolution of the racemic mixtures according to conventional processes, for example, by the formation of diastereoisomeric salts using an optically active acid or base. Examples of appropriate acids are tartaric, diacetyl tartaric, dibenzoyltartaric, ditoluoyltartaric and camphorsulfonic acid. Mixtures of diastereoisomers

can be separated into their individual diastereomers on the basis of their physical chemical differences by methods known to those skilled in the art, for example, by chromatography or fractional crystallization. The optically active bases or acids are liberated from the separated diastereomeric salts. A different process for separation of optical isomers involves the use of a chiral chromatography column (e.g., chiral HPLC columns) optimally chosen to maximize the separation of the enantiomers. Suitable chiral HPLC columns are manufactured by Diacel, e.g., Chiracel OD and Chiracel OJ. The optically active compounds of Formula (I) can likewise be obtained by utilizing optically active starting materials.

10 The compounds of formulae (I), (Ia), (Ib) and (Ic), including all stereoisomeric forms thereof (both isolated and in mixtures), the salts thereof and analogs thereof are collectively referred to herein as "the compounds of this invention."

10 In another embodiment of the invention, a compound according to the invention can be administered to a patient at an oral, intravenous, intramuscular, subcutaneous, or parenteral dosage which can range from about 0.1 to about 300 mg/kg of total body weight.

15 In another embodiment, the cytotoxic or cytostatic agent can be administered to a patient at an intravenous, intramuscular, subcutaneous, or parenteral dosage which can range from about 0.1 mg to 300 mg/kg of patient body weight.

20 Further, the invention relates to a method of inhibiting proliferation of cancer cells comprising contacting cancer cells with a pharmaceutical preparation or product of the invention, especially a method of treating a proliferative disease comprising contacting a subject, cells, tissues or a body fluid of said subject, suspected of having a cancer with a pharmaceutical composition or product of this invention.

25 This invention also relates to compositions containing both a compound according to the invention and the other cytotoxic or cytostatic agents, in the amounts of this invention.

30 This invention further relates to kits comprising separate doses of the two mentioned chemotherapeutic agents in separate containers. The combinations of the invention can also be formed in vivo, e.g., in a patient's body.

The term “cytotoxic” refers to an agent which can be administered to kill or eliminate a cancer cell. The term “cytostatic” refers to an agent which can be administered to restrain tumor proliferation rather than induce cytotoxic cytoreduction yielding an elimination of the cancer cell from the total viable cell population of the patient. The chemotherapeutic agents 5 described herein, e.g., irinotecan, vinorelbine, gemcitabine, and paclitaxel are considered cytotoxic agents. These cytotoxic and cytostatic agents have gained wide spread use as chemotherapeutics in the treatment of various cancer types and are well known.

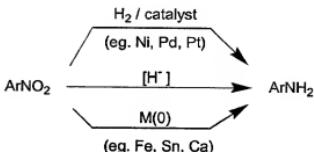

10 These and other cytotoxic/cytostatic agents can be administered in the conventional formulations and regimens in which they are known for use alone.

#### General Preparative Methods

15 The compounds of Formula I may be prepared by the use of known chemical reactions and procedures, some from starting materials which are commercially available. Nevertheless, general preparative methods are provided below to aid one skilled in the art in synthesizing these compounds, with more detailed examples being provided in the Experimental section which follows.

20 Substituted anilines may be generated using standard methods (March. *Advanced Organic Chemistry*, 3<sup>rd</sup> Ed.; John Wiley: New York (1985). Larock. *Comprehensive Organic Transformations*; VCH Publishers: New York (1989)). As shown in Scheme I, aryl amines are commonly synthesized by reduction of nitroaryls using a metal catalyst, such as Ni, Pd, or Pt, and H<sub>2</sub> or a hydride transfer agent, such as formate, cyclohexadiene, or a borohydride 25 (Rylander. *Hydrogenation Methods*; Academic Press: London, UK (1985)). Nitroaryls may also be directly reduced using a strong hydride source, such as LiAlH<sub>4</sub> (Seydel-Penne. *Reductions by the Alumino- and Borohydrides in Organic Synthesis*; VCH Publishers: New York (1991)), or using a zero valent metal, such as Fe, Sn or Ca, often in acidic media. Many methods exist for the synthesis of nitroaryls (March. *Advanced Organic Chemistry*, 3<sup>rd</sup> Ed.;

John Wiley: New York (1985). Larock. *Comprehensive Organic Transformations*; VCH Publishers: New York (1989)).

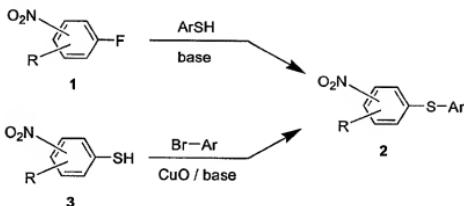

**Scheme I Reduction of Nitroaryls to Aryl Amines**

5 Nitroaryls are commonly formed by electrophilic aromatic nitration using  $\text{HNO}_3$ , or an alternative  $\text{NO}_2^+$  source. Nitroaryls may be further elaborated prior to reduction. Thus, nitroaryls substituted with

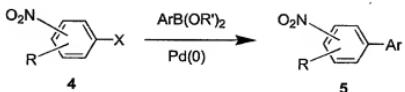

10 potential leaving groups (e.g. F, Cl, Br, etc.) may undergo substitution reactions on treatment with nucleophiles, such as thiolate (exemplified in Scheme II) or phenoxide. Nitroaryls may also undergo Ullman-type coupling reactions (Scheme II).

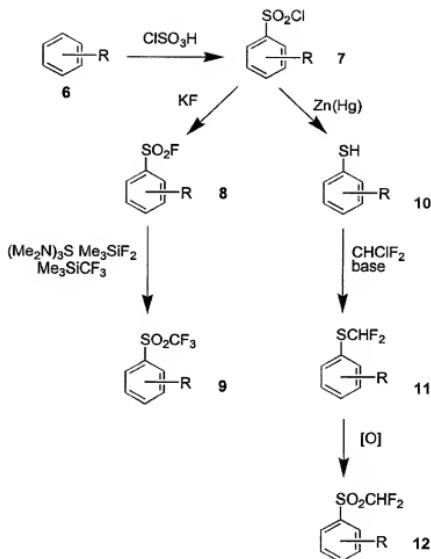

**Scheme II Selected Nucleophilic Aromatic Substitution using Nitroaryls**

Nitroaryls may also undergo transition metal mediated cross coupling reactions. For 15 example, nitroaryl electrophiles, such as nitroaryl bromides, iodides or triflates, undergo palladium mediated cross coupling reactions with aryl nucleophiles, such as arylboronic acids

(Suzuki reactions, exemplified below), aryltins (Stille reactions) or arylzincs (Negishi reaction) to afford the biaryl (5).

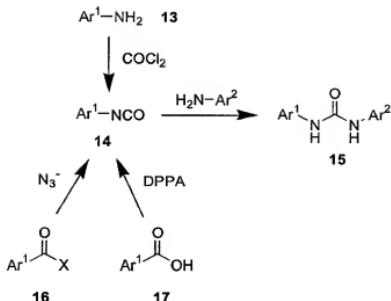

Either nitroaryls or anilines may be converted into the corresponding arenesulfonyl chloride (7) on treatment with chlorosulfonic acid. Reaction of the sulfonyl chloride with a fluoride source, such as KF then affords sulfonyl fluoride (8). Reaction of sulfonyl fluoride 8 with trimethylsilyl trifluoromethane in the presence of a fluoride source, such as tris(dimethylamino)sulfonium difluorotrimethylsiliconate (TASF) leads to the corresponding trifluoromethylsulfone (9). Alternatively, sulfonyl chloride 7 may be reduced to the arenethiol (10), for example with zinc amalgam. Reaction of thiol 10 with CHClF<sub>2</sub> in the presence of base gives the difluoromethyl mercaptam (11), which may be oxidized to the sulfone (12) with any of a variety of oxidants, including CrO<sub>3</sub>-acetic anhydride (Sedova et al. *Zh. Org. Khim.* 1970, 6, (568).

**Scheme III Selected Methods of Fluorinated Aryl Sulfone Synthesis**

As shown in Scheme IV, non-symmetrical urea formation may involve reaction of an aryl isocyanate (14) with an aryl amine (13). The heteroaryl isocyanate may be synthesized from a heteroaryl amine by treatment with phosgene or a phosgene equivalent, such as trichloromethyl chloroformate (diphosgene), bis(trichloromethyl) carbonate (triphosgene), or *N,N'*-carbonyldiimidazole (CDI). The isocyanate may also be derived from a heterocyclic carboxylic acid derivative, such as an ester, an acid halide or an anhydride by a Curtius-type rearrangement. Thus, reaction of acid derivative 16 with an azide source, followed by rearrangement affords the isocyanate. The corresponding carboxylic acid (17) may also be subjected to Curtius-type rearrangements using diphenylphosphoryl azide (DPPA) or a similar reagent.

**Scheme IV Selected Methods of Non-Symmetrical Urea Formation**

Finally, ureas may be further manipulated using methods familiar to those skilled in the art.

5 The invention also includes pharmaceutical compositions including a compound of Formula I, and a physiologically acceptable carrier.

10 The compounds may be administered orally, topically, parenterally, by inhalation or spray or rectally in dosage unit formulations. The term 'administration by injection' includes intravenous, intramuscular, subcutaneous and parenteral injections, as well as use of infusion techniques. One or more compounds may be present in association with one or more non-toxic pharmaceutically acceptable carriers and if desired other active ingredients.

15 Compositions intended for oral use may be prepared according to any suitable method known to the art for the manufacture of pharmaceutical compositions. Such compositions may contain one or more agents selected from the group consisting of diluents, sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets.

20 These excipients may be, for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; and binding agents, for example magnesium

stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and adsorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glycercyl monostearate or glycercyl distearate may be employed. These compounds may also 5 be prepared in solid, rapidly released form.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with 10 water or an oil medium, for example peanut oil, liquid paraffin or olive oil.

Aqueous suspensions contain the active materials in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethylcellulose, methylcellulose, hydroxypropyl methylcellulose, sodium 15 alginate, polyvinylpyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally occurring phosphatide, for example, lecithin, or condensation products or an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethylene 20 oxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl *p*-hydroxybenzoate, one or more 25 coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose or saccharin.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents 30 and suspending agents are exemplified by those already mentioned above. Additional excipients, for example, sweetening, flavoring and coloring agents, may also be present.

The compounds may also be in the form of non-aqueous liquid formulations, e.g., oily suspensions which may be formulated by suspending the active ingredients in a vegetable oil, for example arachis oil, olive oil, sesame oil or peanut oil, or in a mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide palatable oral preparations. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

10 Pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring gums, for example gum acacia or gum tragacanth, naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavoring agents.

15 Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavoring and coloring agents.

20 The compounds may also be administered in the form of suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials include 25 cocoa butter and polyethylene glycols.

30 For all regimens of use disclosed herein for compounds of Formula I, the daily oral dosage regimen will preferably be from 0.01 to 200 mg/Kg of total body weight. The daily dosage for administration by injection, including intravenous, intramuscular, subcutaneous and parenteral injections, and use of infusion techniques will preferably be from 0.01 to 200 mg/Kg of total body weight. The daily rectal dosage regime will preferably be from 0.01 to

200 mg/Kg of total body weight. The daily topical dosage regime will preferably be from 0.1 to 200 mg administered between one to four times daily. The daily inhalation dosage regime will preferably be from 0.01 to 10 mg/Kg of total body weight.

Followed by Ester Saponification, Curtius Rearrangement, and  
Carbamate Deprotection. Synthesis of 2-Amino-3-methoxynaphthalene.**

**Step 1. Methyl 3-methoxy-2-naphthoate**

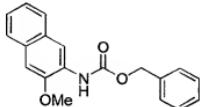

10 A slurry of methyl 3-hydroxy-2-naphthoate (10.1 g, 50.1 mmol) and K<sub>2</sub>CO<sub>3</sub> (7.96 g, 57.6 mmol) in DMF (200 mL) was stirred at room temp. for 15 min., then treated with iodomethane (3.43 mL, 55.1 mmol). The mixture was allowed to stir at room temp. overnight, then was treated with water (200 mL). The resulting mixture was extracted with EtOAc (2 x 200 mL). The combined organic layers were washed with a saturated NaCl solution (100 mL), dried (MgSO<sub>4</sub>), concentrated under reduced pressure (approximately 0.4 mmHg (5.2 x 10<sup>-4</sup> atm) overnight) to give methyl 3-methoxy-2-naphthoate as an amber oil (10.30 g): <sup>1</sup>H-NMR (DMSO-d<sub>6</sub>) δ 2.70 (s, 3H), 2.85 (s, 3H), 7.38 (app t, *J*=8.09 Hz, 1H), 7.44 (s, 1H), 7.53 (app t, *J*=8.09 Hz, 1H), 7.84 (d, *J*=8.09 Hz, 1H), 7.90 (s, 1H), 8.21 (s, 1H).

**20 Step 2. 3-Methoxy-2-naphthoic acid**

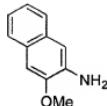

25 A solution of methyl 3-methoxy-2-naphthoate (6.28 g, 29.10 mmol) and water (10 mL) in MeOH (100 mL) at room temp. was treated with a 1 N NaOH solution (33.4 mL, 33.4 mmol). The mixture was heated at the reflux temp. for 3 h, cooled to room temp., and made acidic with a 10% citric acid solution. The resulting solution was extracted with EtOAc (2 x 100 mL). The combined organic layers were washed with a saturated NaCl solution, dried (MgSO<sub>4</sub>) and concentrated under reduced pressure. The residue was triturated with hexane

then washed several times with hexane to give 3-methoxy-2-naphthoic acid as a white solid (5.40 g, 92%):  $^1\text{H-NMR}$  (DMSO-d<sub>6</sub>)  $\delta$  3.88 (s, 3H), 7.34-7.41 (m, 2H), 7.49-7.54 (m, 1H), 7.83 (d,  $J$ =8.09 Hz, 1H), 7.91 (d,  $J$ =8.09 Hz, 1H), 8.19 (s, 1H), 12.83 (br s, 1H).

5 **Step 3. 2-(N-(Carbobenzyloxy)amino-3-methoxynaphthalene**

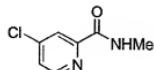

A solution of 3-methoxy-2-naphthoic acid (3.36 g, 16.6 mmol) and Et<sub>3</sub>N (2.59 mL, 18.6 mmol) in anh toluene (70 mL) was stirred at room temp. for 15 min., then treated with a solution of DPPA (5.12 g, 18.6 mmol) in toluene (10 mL) *via* pipette. The resulting mixture was heated at 80 °C for 2 h. After cooling the mixture to room temp., benzyl alcohol (2.06 mL, 20 mmol) was added *via* syringe. The mixture was then warmed to 80 °C overnight. The resulting mixture was cooled to room temp., quenched with a 10% citric acid solution, and extracted with EtOAc (2 x 100 mL). The combined organic layers were washed with a saturated NaCl solution, dried (MgSO<sub>4</sub>) and concentrated under reduced pressure. The residue was purified by column chromatography (14% EtOAc/86% hexane) to give 2-(N-(carbobenzyloxy)amino-3-methoxynaphthalene as a pale yellow oil (5.1 g, 100%):  $^1\text{H-NMR}$  (DMSO-d<sub>6</sub>)  $\delta$  3.89 (s, 3H), 5.17 (s, 2H), 7.27-7.44 (m, 8H), 7.72-7.75 (m, 2H), 8.20 (s, 1H), 8.76 (s, 1H).

Step 4. **2-Amino-3-methoxynaphthalene**

20 A slurry of 2-(N-(carbobenzyloxy)amino-3-methoxynaphthalene (5.0 g, 16.3 mmol) and 10% Pd/C (0.5 g) in EtOAc (70 mL) was maintained under a H<sub>2</sub> atm (balloon) at room temp. overnight. The resulting mixture was filtered through Celite® and concentrated under reduced pressure to give 2-amino-3-methoxynaphthalene as a pale pink powder (2.40 g, 85%):  $^1\text{H-NMR}$  (DMSO-d<sub>6</sub>)  $\delta$  3.86 (s, 3H), 6.86 (s, 2H), 7.04-7.16 (m, 2H), 7.43 (d,  $J$ =8.0 Hz, 1H), 7.56 (d,  $J$ =8.0 Hz, 1H); EI-MS *m/z* 173 (M<sup>+</sup>).

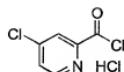

A2. **Synthesis of  $\omega$ -Carbamyl Anilines via Formation of a Carbamylpyridine Followed by Nucleophilic Coupling with an Aryl Amine. Synthesis of 4-(2-N-Methylcarbamyl-4-pyridyloxy)aniline**

5

**Step 1a. Synthesis of 4-chloro-N-methyl-2-pyridinecarboxamide via the Menisci reaction**

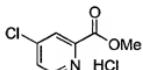

**Caution:** this is a highly hazardous, potentially explosive reaction. To a stirring solution of 4-chloropyridine (10.0 g) in *N*-methylformamide (250 mL) at room temp. was added conc. H<sub>2</sub>SO<sub>4</sub> (3.55 mL) to generate an exotherm. To this mixture was added H<sub>2</sub>O<sub>2</sub> (30% wt in H<sub>2</sub>O, 17 mL) followed by FeSO<sub>4</sub>·7H<sub>2</sub>O (0.56 g) to generate another exotherm. The resulting mixture was stirred in the dark at room temp. for 1 h, then warmed slowly over 4 h to 45 °C. When bubbling had subsided, the reaction was heated at 60 °C for 16 h. The resulting opaque brown solution was diluted with H<sub>2</sub>O (700 mL) followed by a 10% NaOH solution (250 mL). The resulting mixture was extracted with EtOAc (3 x 500 mL). The organic phases were washed separately with a saturated NaCl solution (3 x 150 mL), then they were combined, dried (MgSO<sub>4</sub>) and filtered through a pad of silica gel with the aid of EtOAc. The resulting brown oil was purified by column chromatography (gradient from 50% EtOAc/50% hexane to 80% EtOAc/20% hexane). The resulting yellow oil crystallized at 0 °C over 72 h to give 4-chloro-*N*-methyl-2-pyridinecarboxamide (0.61 g, 5.3%): TLC (50% EtOAc/50% hexane) R<sub>f</sub> 0.50; <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 3.04 (d, *J*=5.1 Hz, 3H), 7.43 (dd, *J*=5.4, 2.4 Hz, 1H), 7.96 (br s, 1H), 8.21 (s, 1H), 8.44 (d, *J*=5.1 Hz, 1H); CI-MS *m/z* 171 ((M+H)<sup>+</sup>).

25 **Step 1b. Synthesis of 4-chloropyridine-2-carbonyl chloride HCl salt via picolinic acid**

Anhydrous DMF (6.0 mL) was slowly added to SOCl<sub>2</sub> (180 mL) between 40° and 50 °C. The solution was stirred in that temperature range for 10 min. then picolinic acid (60.0 g, 487

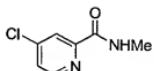

mmol) was added in portions over 30 min. The resulting solution was heated at 72 °C (vigorous SO<sub>2</sub> evolution) for 16 h to generate a yellow solid precipitate. The resulting mixture was cooled to room temp., diluted with toluene (500 mL) and concentrated to 200 mL. The toluene addition/concentration process was repeated twice. The resulting nearly dry residue was filtered and the solids were washed with toluene (2 x 200 mL) and dried under high vacuum for 4 h to afford 4-chloropyridine-2-carbonyl chloride HCl salt as a yellow-orange solid (92.0 g, 89%).

**Step 2. Synthesis of methyl 4-chloropyridine-2-carboxylate HCl salt**

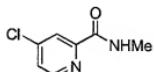

Anh DMF (10.0 mL) was slowly added to SOCl<sub>2</sub> (300 mL) at 40-48 °C. The solution was stirred at that temp. range for 10 min., then picolinic acid (100 g, 812 mmol) was added over 30 min. The resulting solution was heated at 72 °C (vigorous SO<sub>2</sub> evolution) for 16 h to generate a yellow solid. The resulting mixture was cooled to room temp., diluted with toluene (500 mL) and concentrated to 200 mL. The toluene addition/concentration process was repeated twice. The resulting nearly dry residue was filtered, and the solids were washed with toluene (50 mL) and dried under high vacuum for 4 hours to afford 4-chloropyridine-2-carbonyl chloride HCl salt as an off-white solid (27.2 g, 16%). This material was set aside.

The red filtrate was added to MeOH (200 mL) at a rate which kept the internal temperature below 55 °C. The contents were stirred at room temp. for 45 min., cooled to 5 °C and treated with Et<sub>2</sub>O (200 mL) dropwise. ## BIOLOGICAL EXAMPLES

### P38 Kinase Assay:

The *in vitro* inhibitory properties of compounds were determined using a p38 kinase inhibition assay. P38 activity was detected using an *in vitro* kinase assay run in 96-well microtiter plates. Recombinant human p38 (0.5  $\mu$ g/mL) was mixed with substrate (myelin basic protein, 5  $\mu$ g/mL) in kinase buffer (25 mM Hepes, 20 mM MgCl<sub>2</sub> and 150 mM NaCl) and compound. One  $\mu$ Ci/well of <sup>33</sup>P-labeled ATP (10  $\mu$ M) was added to a final volume of 100  $\mu$ L. The reaction was run at 32 °C for 30 min. and stopped with a 1M HCl solution. The amount of radioactivity incorporated into the substrate was determined by trapping the labeled substrate onto negatively charged glass fiber filter paper using a 1% phosphoric acid solution and read with a scintillation counter. Negative controls include substrate plus ATP alone.

All compounds exemplified displayed p38 IC<sub>50</sub>s of between 1 nM and 10  $\mu$ M.

**LPS Induced TNF $\alpha$  Production in Mice:**

The *in vivo* inhibitory properties of selected compounds were determined using a murine LPS induced TNF $\alpha$  production *in vivo* model. BALB/c mice (Charles River Breeding Laboratories; Kingston, NY) in groups of ten were treated with either vehicle or compound by the route noted. After one hour, endotoxin (*E. coli* lipopolysaccharide (LPS) 100  $\mu$ g) was administered intraperitoneally (i.p.). After 90 min, animals were euthanized by carbon dioxide asphyxiation and plasma was obtained from individual animals by cardiac puncture into heparinized tubes. The samples were clarified by centrifugation at 12,500  $\times$  g for 5 min at 4 °C. The supernatants were decanted to new tubes, which were stored as needed at -20 °C. TNF $\alpha$  levels in sera were measured using a commercial murine TNF ELISA kit (Genzyme).

**In Vitro raf Kinase Assay:**

In an in vitro kinase assay, raf is incubated with MEK in 20 mM Tris-HCl, pH 8.2 containing 2 mM 2-mercaptoethanol and 100 mM NaCl. This protein solution (20  $\mu$ L) is mixed with water (5  $\mu$ L) or with compounds diluted with distilled water from 10 mM stock solutions of compounds dissolved in DMSO. The kinase reaction is initiated by adding 25  $\mu$ L [ $\gamma$ -<sup>33</sup>P]ATP (1000-3000 dpm/pmol) in 80 mM Tris-HCl, pH 7.5, 120 mM NaCl, 1.6 mM DTT, 16 mM MgCl<sub>2</sub>. The reaction mixtures are incubated at 32 °C, usually for 22 min. Incorporation of <sup>33</sup>P into protein is assayed by harvesting the reaction onto phosphocellulose mats, washing away free counts with a 1% phosphoric acid solution and quantitating phosphorylation by liquid scintillation counting. For high throughput screening, 10  $\mu$ M ATP and 0.4  $\mu$ M MEK

are used. In some experiments, the kinase reaction is stopped by adding an equal amount of Laemmli sample buffer. Samples are boiled 3 min and the proteins resolved by electrophoresis on 7.5% Laemmli gels. Gels are fixed, dried and exposed to an imaging plate (Fuji). Phosphorylation is analyzed using a Fujix Bio-Imaging Analyzer System.

All compounds exemplified displayed IC<sub>50</sub>s of between 1 nM and 10  $\mu$ M.

Cellular Assay:

For in vitro growth assay, human tumor cell lines, including but not limited to HCT116 and

10 DLD-1, containing mutated K-ras genes are used in standard proliferation assays for

anchorage dependent growth on plastic or anchorage independent growth in soft agar.

Human tumor cell lines were obtained from ATCC (Rockville MD) and maintained in RPMI

with 10% heat inactivated fetal bovine serum and 200 mM glutamine. Cell culture media

and additives are obtained from Gibco/BRL (Gaithersburg, MD) except for fetal bovine

15 serum (JRH Biosciences, Lenexa, KS). In a standard proliferation assay for anchorage

dependent growth,  $3 \times 10^3$  cells are seeded into 96-well tissue culture plates and allowed to

attach overnight at 37 °C in a 5% CO<sub>2</sub> incubator. Compounds are titrated in media in dilution

series and added to 96 well cell cultures. Cells are allowed to grow 5 days typically with a

feeding of fresh compound containing media on day three. Proliferation is monitored by

20 measuring metabolic activity with standard XTT colorimetric assay (Boehringer Mannheim)

measured by standard ELISA plate reader at OD 490/560, or by measuring <sup>3</sup>H-thymidine

incorporation into DNA following an 8 h culture with 1  $\mu$ Ci <sup>3</sup>H-thymidine, harvesting the

cells onto glass fiber mats using a cell harvester and measuring <sup>3</sup>H-thymidine incorporation

by liquid scintillant counting.

25

For anchorage independent cell growth, cells are plated at  $1 \times 10^3$  to  $3 \times 10^3$  in 0.4%

Seaplaque agarose in RPMI complete media, overlaying a bottom layer containing only

0.64% agar in RPMI complete media in 24-well tissue culture plates. Complete media plus

dilution series of compounds are added to wells and incubated at 37 °C in a 5% CO<sub>2</sub>

30 incubator for 10-14 days with repeated feedings of fresh media containing compound at 3-4

day intervals. Colony formation is monitored and total cell mass, average colony size and

number of colonies are quantitated using image capture technology and image analysis software (Image Pro Plus, media Cybernetics).

These assays establish that the compounds of Formula I are active to inhibit raf kinase

5 activity and to inhibit oncogenic cell growth.

*In Vivo Assay:*

An *in vivo* assay of the inhibitory effect of the compounds on tumors (e.g., solid cancers) mediated by raf kinase can be performed as follows:

10 CDI nu/nu mice (6-8 weeks old) are injected subcutaneously into the flank at  $1 \times 10^6$  cells with human colon adenocarcinoma cell line. The mice are dosed i.p., i.v. or p.o. at 10, 30, 100, or 300 mg/Kg beginning on approximately day 10, when tumor size is between 50-100 mg. Animals are dosed for 14 consecutive days; tumor size is monitored with calipers twice a week.

15 The inhibitory effect of the compounds on raf kinase and therefore on tumors (e.g., solid cancers) mediated by raf kinase can further be demonstrated *in vivo* according to the technique of Monia et al. (*Nat. Med.* 1996, 2, 668-75).
